

## **IN THE CLAIMS**

Please accept amended claims 1, 3 and 5 and new claim 32 as follows. Please cancel claim 2 without prejudice.

1. (Currently Amended) A color filter panel for a liquid crystal display, comprising:

a substrate;

a color filter formed over the substrate; and

a passivation layer that covers the color filter and that has a varying thickness,

wherein the color filter includes first and second portions with different thickness, the first portion has a larger thickness and the second portion has a smaller thickness, and the second portion is located along a line that a pixel area is defined by, and the first portion is located within an area surrounded by the second portion,

wherein the liquid crystal display includes a first display area that displays images using a light source provided therein and a second display area that displays images using an external light.

2. canceled

3. (currently amended) The color filter panel of claim [[2]]1, wherein the thickness of the passivation layer in the first display area is smaller than the thickness of the passivation layer in the second display area.

4. (Original) The color filter panel of claim 3, wherein the thickness of the passivation layer in the first display area is zero (0).

5. (Currently amended) The color filter panel of claim ~~[[2]]~~1, wherein the second portion with the smaller thickness of the color filter is located in an area corresponding to the second display area, and the first portion with the larger thickness of the color filter is located in an area corresponding to the first display area.

6. (Canceled)

7. (previously presented) The color filter panel of claim 1, wherein a light-blocking member is located near the edge of the color filter.

8. (previously presented) The color filter panel of claim 7, wherein a portion of the color filter overlapping the light-blocking member has a thickness smaller than the thickness of the second portion with the smaller thickness of the color filter.

9. (Canceled)

10. (Original) The color filter panel of claim 1, further comprising a common electrode formed over the substrate.

11-31. (Canceled)

32. (New) A color filter panel for a liquid crystal display, comprising:  
a substrate;  
a color filter formed over the substrate; and  
a passivation layer that covers the color filter and that has a varying thickness,  
wherein the color filter includes first and second portions with different thickness,  
the first portion has a larger thickness and the second portion has a smaller thickness, and  
the second portion is located along a line that a pixel area is defined by, and the first  
portion is located within an area surrounded by the second portion,  
wherein a light-blocking member is located near the edge of the color filter, and a  
portion of the color filter overlapping the light-blocking member has a thickness smaller  
than the thickness of the second portion with the smaller thickness of the color filter.
